

OyezForms Now integrates with SharePoint

OyezForms has recently completed integration between their forms software and SharePoint document repositories.

SharePoint is used by organisations to create websites, where information can be stored, organised and shared securely online. The new OyezForms / SharePoint integration means that forms can now be retrieved and edited from standard SharePoint Web pages in the same manner as Word documents. Users are prompted to check out forms if required, but also have the option of read-only review. All aspects of version publishing are supported.

Users can now upload newly created forms into SharePoint and tag them as appropriate to provide context. Oyez are willing to assist any required customisation of this aspect of the integration.

Oyez has developed an interface for opening and saving forms to/from SharePoint's DMS features. Standard web pages generated by SharePoint provide the user search/browse/open experience. Newly-created OyezForms and FILE>SAVE-AS actions trigger a choice of saving into SharePoint or the local filesystem.

Commenting on the integration, Stephen Martin, Technical Director of OyezForms said "**The key to this successful integration was adhering to the normal SharePoint experience that users are familiar with. We are delighted to offer this new functionality to Oyez form customers and our case / document management partners.**"
